EINSTEIN
FULL-BODY POSITIONING SYSTEM

For greater comfort and quality of life

EINSTEIN is a low-positioned reclining chair designed for safe and stabilising positioning. Its low centre of gravity and lateral body support guide the pelvis, trunk and extremities into targeted positions that provide therapeutic support.

A PLACE AT THE HEART OF FAMILY LIFE

Children with complex support needs often spend much of their everyday lives in a wheelchair or therapeutic seating system. When it comes to taking a relaxed break, the options are often limited to the sofa, without the positioning support they need, or to the bed. **EINSTEIN** fills this gap: it offers a comfortable yet supportive alternative for use at home. It creates a special place to relax, play or simply be part of what's happening – right at the heart of family life, rather than on the sidelines.

THERAPEUTIC BENEFITS

- stabilisation and alignment of the body
- relief of joints and pressure areas
- support for contractures and spasms
- improved pelvic and trunk positioning
- targeted pressure distribution and relief
- support for post-operative positioning

INDICATIONS

- cerebral palsy
- myelodysplasia
- muscular dystrophies
- scoliotic spinal deformities
- postural deformities and instabilities

COMFORT AND STABILITY

The multi-layered foam construction combines stable pelvic support with optimal seating comfort. Different foam densities provide stability, pressure distribution and a comfortable fit to the body.

MADE IN GERMANY

High-quality, durable and easy-to-clean materials, textiles tested for harmful substances, and compliance with applicable medical device requirements stand for quality and safety.

INDIVIDUALLY ADJUSTABLE

With functional accessories, the **EINSTEIN** can be optimally tailored to the individual needs of each user - from the leg support and neck and arm supports to the therapy table, pelvic belt and rocking function.
